Abstract. Background: Child sexual abuse (CSA) is widespread and is associated with various psychopathologies, including Axis I and II disorders, maladaptive and impulsive behaviors, and suicidal behavior in adolescence and adults. Though the authors have looked into the future mental health impact of child sexual abuse, it seems quite obvious that the study itself was done with the data being collected retrospectively. The authors have retrospectively identified their subjects by checking a register which records child sexual abuse. 1. Int J Adolesc Med Health. 2013;25(3):201-5. doi: 10.1515/ijamh-2013-0053.
