COMPILER DESIGN LECTURE NOTES (Subject Code: BCS-305) for Bachelor of Technology in Computer Science and Engineering & Information Technology Department of Computer Science and Engineering & Information Technology A compiler implements a formal transformation from a high-level source program to a low-level target program. Compiler design can define an end to end solution or tackle a defined subset that interfaces with other compilation tools e.g. preprocessors, assemblers, linkers. In compiler optimization, register allocation is the process of assigning a large number of target program variables onto a small number of CPU registers. Designing a Programming Language: I. Designing a language and building an interpreter from beginning to end. Part 1: The Premise. Programming languages come in a variety of different paradigms. - Solution Of Compiler Design Aho Ullman
